

S3 – Streaming and final exercises

Last seminar!!! You almost did it!!

**1) (last FFMpeg you're going to write!)
Remember you have the BBB video converted into
these?**

720p

480p

360x240

160x120

- **Convert them into VP8, VP9, h265 & AV1. You can use the script that allows you to transform, or create a new script.**

2.-) Once you have the ‘mandanga’, try to create a new video as the one of the 4 videos at the same time we saw in class, and please analyze by yourself and comment how these codecs work at each bitrate

3.-) Last exercise. If you're not able to finish it, at least prepare screenshots and detailed info of everything you've researched and the steps where you've arrived.

Try to achieve with FFMpeg or FFServer to create a live streaming of the BBB Video. You should broadcast it into an IP address (locally of course) and open this IP or URL inside VLC Media Player.

4.-) Try to generate a python script that enables/activates the online streaming

Thanks
